	nich notation would you use to denote the 3rd layer's activations when the input is the 7th example from the 8th nibatch?	1 / 1 point
C	$a^{[8]\{7\}(3)}$	
С	a <sup>[8]</sup> {3}(7)	
•	a[3]{8}(7)	
С	$a^{[3]\{7\}(8)}$	
	✓ Correct	
2. WI	nich of these statements about mini-batch gradient descent do you agree with?	1 / 1 point
С	You should implement mini-batch gradient descent without an explicit for-loop over different mini-batches, so that the algorithm processes all mini-batches at the same time (vectorization).	
•	One iteration of mini-batch gradient descent (computing on a single mini-batch) is faster than one iteration of batch gradient descent.	
С	Training one epoch (one pass through the training set) using mini-batch gradient descent is faster than training one epoch using batch gradient descent.	
	✓ Correct	
B. W	ny is the best mini-batch size usually not 1 and not m, but instead something in-between?	1 / 1 point
~	If the mini-batch size is 1, you lose the benefits of vectorization across examples in the mini-batch.	
	✓ Correct	
	If the mini-batch size is m, you end up with stochastic gradient descent, which is usually slower than mini-batch gradient descent.	
<b>~</b>	If the mini-batch size is m, you end up with batch gradient descent, which has to process the whole training set before making progress.	
	✓ Correct	
	If the mini-batch size is 1, you end up having to process the entire training set before making any progress.	

 ${\it 4.} \quad {\it Suppose your learning algorithm's cost} \ {\it J}, \\ {\it plotted as a function of the number of iterations, looks like this:}$ 

Whether you're using batch gradient descent or mini-batch gradient descent, this looks acceptable.
<ul><li>If you're using mini-batch gradient descent, this looks acceptable. But if you're using batch gradient descent, something is wrong.</li></ul>
O If you're using mini-batch gradient descent, something is wrong. But if you're using batch gradient descent, this looks acceptable.
Whether you're using batch gradient descent or mini-batch gradient descent, something is wrong.
✓ Correct

5. Suppose the temperature in Casablanca over the first three days of January are the same:

1/1 point

```
Jan 1st: 	heta_1=10^oC
```

Jan 2nd:  $heta_2 10^o C$ 

(We used Fahrenheit in lecture, so will use Celsius here in honor of the metric world.)

Say you use an exponentially weighted average with  $\beta=0.5$  to track the temperature:  $v_0=0$ ,  $v_t=\beta v_{t-1}+(1-\beta)\theta_t$ . If  $v_2$  is the value computed after day 2 without bias correction, and  $v_2^{corrected}$  is the value you compute with bias correction. What are these values? (You might be able to do this without a calculator, but you don't actually need one. Remember what is bias correction doing.)

- $\bigcirc v_2 = 7.5, v_2^{corrected} = 7.5$
- $\bigcirc \ v_2=10, v_2^{corrected}=10$
- $\bigcirc \ v_2=10 \text{, } v_2^{corrected}=7.5$

 $6. \quad \text{Which of these is NOT a good learning rate decay scheme? Here, t is the epoch number.} \\$ 

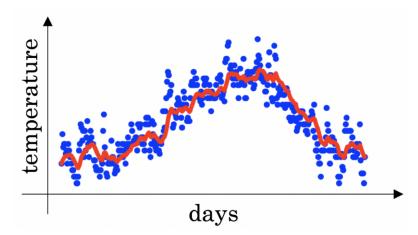

1/1 point

- $\bigcirc \ \alpha = 0.95^t \alpha_0$
- $\bigcap \alpha = \frac{1}{1+2*t}\alpha_0$
- $\bigcap \alpha = \frac{1}{\sqrt{t}}\alpha_0$

✓ Correct

7. You use an exponentially weighted average on the London temperature dataset. You use the following to track the temperature:  $v_t=\beta v_{t-1}+(1-\beta)\theta_t$ . The red line below was computed using  $\beta=0.9$ . What would happen to your red curve as you vary  $\beta$ ? (Check the two that apply)

1 / 1 point

lacksquare Increasing eta will shift the red line slightly to the right.

✓ Corre

True, remember that the red line corresponds to  $\beta=0.9$ . In lecture we had a green line \$\$\beta=0.98\$) that is cliable while to the girls.

slightly shifted to the right.  $\hfill \square$  Decreasing  $\beta$  will create more oscillation within the red line. ✓ Correct True, remember that the red line corresponds to eta=0.9. In lecture we had a yellow line \$\beta = 0.98 that had a lot of oscillations.  $\hfill \square$  Increasing  $\beta$  will create more oscillations within the red line. 8. Consider this figure: (2)(3)These plots were generated with gradient descent; with gradient descent with momentum ( $\beta$  = 0.5) and gradient descent with momentum ( $\beta$  = 0.9). Which curve corresponds to which algorithm?  $\bigcirc$  (1) is gradient descent with momentum (small  $\beta$ ), (2) is gradient descent with momentum (small  $\beta$ ), (3) is gradient lacktriangledown (1) is gradient descent. (2) is gradient descent with momentum (small eta). (3) is gradient descent with momentum (large  $\beta$ )  $\bigcirc$  (1) is gradient descent with momentum (small eta). (2) is gradient descent. (3) is gradient descent with momentum  $\bigcirc$  (1) is gradient descent. (2) is gradient descent with momentum (large eta) . (3) is gradient descent with momentum (small  $\beta$ ) ✓ Correct 9. Suppose batch gradient descent in a deep network is taking excessively long to find a value of the parameters that achieves a small value for the cost function  $\mathcal{J}(W^{[1]},b^{[1]},...,W^{[L]},b^{[L]})$ . Which of the following techniques could help find parameter values that attain a small value for  $\mathcal{J}$ ? (Check all that apply) Try better random initialization for the weights ✓ Correct lacksquare Try tuning the learning rate lpha✓ Correct Try initializing all the weights to zero Try mini-batch gradient descent ✓ Correct Try using Adam ✓ Correct 10. Which of the following statements about Adam is False? 1 / 1 point  $\bigcirc$  We usually use "default" values for the hyperparameters  $\beta_1,\beta_2$  and  $\varepsilon$  in Adam ( $\beta_1=0.9,\beta_2=0.999,\varepsilon=10^{-8}$ ) Adam should be used with batch gradient computations, not with mini-batches. Adam combines the advantages of RMSProp and momentum igcup The learning rate hyperparameter lpha in Adam usually needs to be tuned. ✓ Correct
